

I · EXECUTIVE SUMMARY

This is the final Statement of Work for the Real Estate Transaction Management Portal — a purpose-built web platform for Kathryn Santos, an independent Transaction Coordinator managing 80+ active California real estate transactions simultaneously. This version reflects all scope items confirmed across multiple discovery sessions including the April 10, 2026 meeting, and incorporates a fully resolved technical approach for the DocuSign e-signature workflow.

Kathryn currently manages her entire business across four disconnected platforms: Excel spreadsheets, Google Drive, Glide (for document creation and e-signing), and DocuSign. Every task requires switching between tools, manually rebuilding folder structures, copying and pasting data, and placing signature fields by hand on dozens of documents at a time. This portal replaces all of that with a single, unified system.

The most significant clarification in this final version is the DocuSign integration approach. Following detailed technical analysis of Kathryn's workflow — specifically how she currently handles both seller-side and buyer-side documents — a clean, fully buildable solution has been identified that replicates the signature field auto-placement she currently relies on in Glide, without requiring any special platform partnerships or licensing.

II · THE DOCUSIGN SOLUTION — FULLY RESOLVED

The most important feature to get right in this portal is the e-signature workflow. This section explains exactly how it works, why it works, and what Kathryn's experience will be — in plain terms.

The Problem Being Solved

Kathryn currently uses Glide connected to DocuSign. When she uploads a document and clicks send for signature, the signature, date, and initials fields automatically appear in the correct positions — she never has to drag and drop them manually. This saves her enormous time given she manages up to 100 documents per transaction across 80+ active files simultaneously. Replicating this experience inside the custom portal is the core requirement of the DocuSign module.

Understanding Kathryn's Two Document Scenarios

After careful analysis of Kathryn's workflow, there are two distinct situations she deals with:

- ◆ **Seller Side — Listing Files** — Kathryn prepares and sends the documents herself. These are always the same standard California Association of Realtors (CAR) forms — the Transfer Disclosure Statement, Natural Hazard Disclosure, Listing Agreement, and so on. The document never changes. Only the client name, property address, and dates are different each time.

- ◆ **Buyer Side — Buyer Representation Files** — Documents arrive to Kathryn from the other party, already filled in as PDFs. She does not create these — they come from the seller's agent. However, they are still the same standard CAR forms, just with someone else's client data already on them. The document structure, layout, and where the signature lines sit are identical every single time.

This distinction is the key insight. Because California real estate uses fully standardized forms across the entire industry, Kathryn is always dealing with the same 50–60 document types — regardless of which side of the transaction she is on. This makes a complete, elegant solution possible.

The Solution — DocuSign Template Engine

The portal will include a Document Template Engine — a system that stores the exact position of every signature, date, and initials field for each of Kathryn's 50–60 standard documents. Here is how it works:

- ◆ **One-time setup at kickoff** — During the project kickoff session, Kathryn provides all 50–60 standard document templates. Each document is loaded into the portal's template manager. The signature, date, and initials fields are placed once on each document — this takes approximately one full working day total and never needs to be repeated unless CAR updates a form.
- ◆ **Every send after that is automatic** — When Kathryn clicks Send for Signature on any document — whether she created it herself or received it from the other party — the portal identifies the document type, retrieves the saved field positions, and passes them to DocuSign automatically. DocuSign places the fields in exactly the right spots. Kathryn never drags or drops a single field again.
- ◆ **Incoming PDFs from the other side** — Because standard CAR forms always contain their own title and form number within the document, the portal can read the uploaded PDF, identify which document type it is, and apply the correct saved template automatically. Buyer-side documents are handled identically to seller-side documents — same experience, same automation.
- ◆ **Truly unknown documents (rare edge case)** — On the rare occasion a non-standard document arrives — a custom lender addendum or a one-off agreement that is not a standard CAR form — Kathryn sees a simple prompt to confirm which template to apply, or she places fields manually in DocuSign as she does today. Based on her described workflow this is an uncommon occurrence.

What Kathryn's Experience Looks Like

The flow is identical regardless of document type — seller side, buyer side, standard form, or externally received PDF:

- ◆ Kathryn opens the DocuSign module inside the portal.
- ◆ She either selects a document already in the transaction checklist, or uploads a PDF she received from the other party.
- ◆ The portal identifies the document type and applies the saved signature field positions automatically.
- ◆ She assigns the recipients — Seller, Buyer, Agent, or Escrow — from the contacts already saved in the transaction record.
- ◆ She clicks Send. DocuSign emails each recipient with the document pre-configured with fields in the right places.
- ◆ The recipient opens the DocuSign link, signs, and submits.
- ◆ The signed document returns to the portal automatically. The document status in the checklist updates to Signed. The signed PDF is saved to the correct transaction folder. Kathryn receives a notification.

No special platform partnerships, no Glide dependency, no exotic technology required. This is built entirely on DocuSign's standard public API which is available to any developer. The auto-placement is achieved by saving field coordinates during the one-time setup and passing them to DocuSign programmatically on every send.

III · THE PROBLEM WE ARE SOLVING

Kathryn currently runs her entire transaction coordination business across four separate platforms: an Excel spreadsheet, Google Drive, Glide (for document creation and e-signature), and DocuSign. Every task requires switching between platforms, manually copying data, re-uploading files, and rebuilding folder structures from scratch for every new transaction. The result is an unsustainable amount of repetitive manual work — and real risk of things falling through the cracks at 80+ active transactions.

- ◆ **Spreadsheet overload** — Managing 80+ transactions in Excel tabs with manual copy-paste, formula management, and status tracking is time-consuming and not scalable.
- ◆ **Drive folder creation** — Every new transaction requires manually downloading a master folder, renaming it, re-uploading it to Drive, and linking it back to the spreadsheet.
- ◆ **Disconnected e-signature workflow** — Documents must be sent through Glide to DocuSign, then tracked manually back in the spreadsheet once signed. There is no single place where signature status and document storage live together.
- ◆ **Manual signature field placement** — When uploading PDFs externally to DocuSign, Kathryn must manually drag and drop signature and date fields for every document — extremely time-consuming at 80+ documents per file.
- ◆ **No centralized task view** — There is no single place to see what needs to be done today across all active transactions.

- ◆ **Manual email composition** — Every outbound email to agents and clients must be written from scratch, even when the content follows a standard template.
- ◆ **Manual deadline reminders** — Client deadline reminders are manually composed and sent, even though the content rarely changes.

The portal we are building replaces all of this with one unified system. Kathryn may still use Glide for initial document creation (since that requires a third-party library license she does not yet have) — but every other part of her workflow will be handled inside the portal.

IV · COMPLETE PROJECT SCOPE — PHASE 1

Phase 1 is a complete, production-ready web portal built from scratch using React (frontend) and Node.js (backend). The following modules are included in full:

M O D U L E	W H A T I T D O E S F O R Y O U
Client Management	Add and manage client profiles with full contact details — agent name, buyer/seller info, escrow officer, escrow assistant, and all associated parties. Known contacts auto-complete from a saved contact directory. Search and filter across all clients.
Project / Transaction Module	Create a new project linked to a client — all client details auto-populate instantly. Select transaction type (Listing / Buyer Representation) and fill in property details. The system generates the document checklist automatically based on 10–12 conditional rules replicated from Kathryn's Excel logic.
Smart Document Checklist	For each transaction, the system automatically determines which documents are required based on property attributes (year built, property type, representation side, etc.). Each document is listed with its current status, upload area, and notes thread. Documents not required for this transaction are hidden.
Document Status Tracker	Per-document status tracked via a searchable dropdown: Pending, Needs Buyer Signature, Needs Seller Signature, Out for Signature, Signed — Needs Upload, Uploaded to Brokerage, Completed. Status updates automatically when a document is returned signed via DocuSign.
Per-Transaction Document Storage	Each transaction has a dedicated document storage area — a built-in file manager where Kathryn uploads, stores, organizes, and downloads PDFs throughout the transaction lifecycle. Replaces the

MODULE	WHAT IT DOES FOR YOU
	need for a separate Google Drive folder. Supports upload of partially signed, fully signed, or externally received documents.
Auto-Created Folder Structure	When a new transaction is created, the system automatically generates a standard set of storage folders (e.g., Received — Needs Signature, Buyer Signed, Seller Signed, Completed, Sent to Brokerage). Additional folders can be created manually at any time.
Google Drive Integration	Optional: the portal can be linked to Kathryn's Google Drive (Google Workspace account) so transaction folders are automatically created in Drive when a transaction is opened, and documents uploaded in the portal are synced to the corresponding Drive folder. Final approach confirmed after API research.
DocuSign Integration	Kathryn's DocuSign account is connected to the portal. From the transaction page she selects any document and clicks Send for Signature — the portal identifies the document type, applies the saved field positions, and pushes it to DocuSign automatically. The recipient receives a DocuSign email with signature fields already placed in the correct spots. Once signed, the document returns to the portal automatically, status updates, and Kathryn is notified. She never needs to visit DocuSign's website.
Document Template Engine	The core of the signature automation. All 50–60 of Kathryn's standard CAR documents are configured once during kickoff — signature, date, and initials fields are placed on each document one time and saved permanently. Every subsequent send of that document type — whether Kathryn created it or received it from the other party — uses the saved field positions automatically. No manual drag-and-drop ever again.
Auto-Document Recognition	When Kathryn uploads an external PDF received from another party, the portal reads the document, identifies its type using the form title and number embedded in the document, and applies the correct saved field template automatically. Buyer-side documents are handled identically to seller-side documents — same experience, same automation, no extra steps.
Document Notes (Threaded)	Each document has a date-stamped notes thread — a full history of observations, follow-up actions, and status commentary per document. View the entire thread at a glance.
Task List / Project Stages	Each transaction has a stage-by-stage task roadmap mirroring Kathryn's current checklist. Tasks are checked off as completed.

MODULE	WHAT IT DOES FOR YOU
	Each stage shows which documents are due and what actions are pending.
Next Step Field	A dedicated 'Next Step' text field and date on every transaction — surfaces on the centralized Task Dashboard sorted by date. Can reference a task, a document, a follow-up call, or any action item.
Centralized Task Dashboard	A single daily work list showing every transaction's next step and upcoming task across all 80+ active projects, sorted by date. Click any item to jump directly into that transaction. Replaces navigating 80 spreadsheet tabs every morning.
Outbound Email with Templates	Send emails to agents, clients, and third parties directly from inside the portal using pre-built templates. Templates auto-fill agent name, property address, and all transaction variables. Sent emails are logged in the client's communication thread. Gmail Workspace integration included.
Automated Reminder Draft System	When a transaction deadline is approaching, the system auto-drafts a reminder email pre-filled with the client name, property address, deadline description, and date. Kathryn receives a notification, reviews the draft (editing if needed — e.g., if an extension was granted), and clicks Send. Nothing is sent automatically.
Calendar / Deadline View	A monthly/weekly calendar showing all transaction deadlines and reminders across every active project. Every event is clickable and links directly back to the relevant transaction.
Multi-User Team Access	Add team members to the portal with the same access level as the admin. Assign specific transactions to specific team members. Track who is working on what. Role-based permissions (admin vs. staff access) will be added in Phase 2.
Settings & Template Manager	Create, edit, and manage unlimited email and reminder templates organized by type. Manage connected integrations (DocuSign, Gmail, Google Drive). Configure conditional document rules.

V • WHAT IS NOT INCLUDED IN PHASE 1

The following items were discussed but are deferred to Phase 2, either due to licensing requirements or scope considerations:

- ◆ **Document creation & form-filling** — Creating documents from scratch within the portal and auto-filling client information into form fields requires a licensed document library. Kathryn does not currently have permission to use her third-party library within a custom platform. This will be Phase 2 once licensing is obtained.
- ◆ **In-portal document editing** — Editing the content of uploaded PDFs within the portal. Phase 2.
- ◆ **Role-based permission levels** — Granular admin vs. staff access controls. Phase 2 — initial team access will be equal for all users.
- ◆ **SMS / calling integration** — Email is the primary communication channel for Phase 1.
- ◆ **AI-powered document parsing** — Automated data extraction from incoming PDFs (e.g., reading a received listing agreement and auto-filling client fields). A future enhancement.

VI · USER JOURNEY — A DAY IN THE PORTAL

Here is the complete step-by-step journey through the portal — from the moment a new listing arrives to close of escrow — reflecting the updated workflow with DocuSign and document storage.

Step 1 — A New Listing or Buyer File Arrives

- ◆ Kathryn's client (a real estate agent) sends her the initial contractual documents as a PDF — either a listing agreement (seller side) or a purchase agreement (buyer side).
- ◆ Kathryn logs into the portal and navigates to Clients → Add New Client. She fills in all party details: agent, buyer/seller, escrow officer, escrow assistant. Known contacts auto-complete from the saved directory.

Step 2 — Creating the Transaction

- ◆ Kathryn clicks Projects → Add New Project and selects the client. All details auto-populate. She selects the transaction type (Listing or Buyer) and fills in property details: year built, property type, HOA status, etc.
- ◆ The system immediately generates the correct document checklist — only the documents required for this specific transaction appear, based on the conditional rules engine.
- ◆ Simultaneously, the system auto-creates the transaction's document storage folder structure (e.g., Received, Needs Buyer Signature, Needs Seller Signature, Completed, Sent to Brokerage). No manual Drive setup needed.

Step 3 — Uploading and Tracking Documents

- ◆ For documents that arrive pre-filled and partially signed (common on buyer-side files), Kathryn uploads the PDF directly into the transaction's document storage — into the appropriate folder.

- ◆ She marks the document's checklist status: e.g., 'Needs Seller Signature.' The document is now visible in both the checklist and the storage folder.
- ◆ For documents that Kathryn needs to create and send herself (seller-side listings), she will continue using Glide for document creation and bring the completed PDF back into the portal for signature and storage.

Step 4 — Sending for Signature via DocuSign

- ◆ From the transaction page, Kathryn selects any document — whether she created it herself or received it from the other party as an uploaded PDF — and clicks Send for Signature.
- ◆ The portal identifies the document type automatically and retrieves the pre-saved signature, date, and initials field positions. These are passed to DocuSign instantly. The fields appear in exactly the right spots — no manual placement required.
- ◆ Each recipient — Seller, Buyer, Agent, Escrow — receives their own DocuSign email. They open the link, see their fields pre-positioned, sign, and submit. Kathryn does not need to prepare anything in DocuSign beforehand.
- ◆ Once signed, DocuSign notifies the portal automatically. The signed PDF is saved to the correct transaction folder. The document status in the checklist updates to Signed. Kathryn receives a notification. The entire return process is handled without her touching anything.

Step 5 — Email Communication

- ◆ Kathryn selects a template (e.g., 'Initial Agent Outreach,' 'Document Request,' 'Deadline Reminder'). The template auto-fills with the agent name, property address, and all transaction variables.
- ◆ She reviews, edits if needed, and clicks Send. The email goes out through her connected Gmail Workspace account and is logged in the client's communication thread inside the portal.

Step 6 — Logging Next Steps & Daily Dashboard

- ◆ After completing any work on a transaction, Kathryn logs the next action in the Next Step field with a date. Example: 'Email escrow — confirm receipt of signed disclosure packet — Friday.'
- ◆ Every morning, Kathryn opens the Task Dashboard — a single sorted view of every transaction's next step across all 80+ active files. She clicks any item and lands directly in that transaction. No more spreadsheet tab-hopping.

Step 7 — Deadline Reminders

- ◆ Transaction deadlines are set in the Calendar module. When a deadline approaches, the system auto-drafts a reminder email with the client name, property address, and what the deadline is.
- ◆ Kathryn sees a notification, reviews the draft, edits if circumstances have changed (e.g., extension granted), and approves it to send. Nothing goes out automatically.

Step 8 — Team Collaboration

- ◆ Kathryn adds a team member to the portal and assigns them to specific transactions. The team member logs in with their own credentials and sees only the transactions assigned to them.

- ♦ All activity — document uploads, status changes, notes, emails sent — is logged and visible to the admin. Kathryn has full visibility across all users and transactions at all times.

Milestone 3 is the most technically complex phase — where the portal becomes a fully working, integrated system. Here is what gets built:

Conditional Document Checklist Engine

The 10–12 conditional rules from Kathryn's Excel system are migrated into backend logic. When a project is created and property details are filled in, the system instantly generates the exact document checklist required for that transaction. No manual selection. Kathryn will provide all conditions in a kickoff session and Mobi will build the rules engine accordingly.

DocuSign Integration & Document Template Engine

Kathryn's DocuSign account is connected via the DocuSign API. The portal includes a Document Template Manager — built during the kickoff phase — where all 50–60 standard CAR document types are pre-configured with exact signature, date, and initials field positions saved permanently in the system.

When Kathryn sends any document for signature, the portal retrieves the saved field positions for that document type and passes them directly to DocuSign via the API. DocuSign places the fields exactly where specified. The recipient opens their DocuSign email, sees the fields already in the correct positions, signs, and submits. The signed document is returned to the portal automatically, saved to the correct transaction folder, and the checklist status updates without Kathryn doing anything.

This approach requires no special DocuSign partnership, no Glide dependency, and no exotic technology. It uses DocuSign's standard public API which is freely available to any developer. The field coordinates are saved during a one-time setup session at kickoff — approximately one full working day — and never need to be repeated unless CAR publishes a revised version of a form, which happens roughly once per year.

Auto-Document Recognition for Incoming PDFs

For documents Kathryn receives from the other party — common on buyer-side files — the portal reads the uploaded PDF text, identifies the form type using the title and CAR form number embedded in every standard California real estate document, and automatically applies the matching saved field template. Buyer-side documents are processed identically to seller-side documents. In the rare case of a truly non-standard document, Kathryn receives a prompt to select the closest template or place fields manually — the same as her current workflow today.

Per-Transaction Document Storage & Folder System

Each transaction gets its own document storage area with auto-created subfolders matching Kathryn's current Drive structure. Uploaded PDFs are stored and organized within the portal. Kathryn can upload documents at any stage — partially signed, fully signed, received from third parties — and move them between folders as their status changes. All documents are downloadable at any time.

Google Drive Integration

If Kathryn prefers to keep Google Drive as the primary file storage backend, the portal will be connected to her Google Workspace account. When a new transaction is created, the system automatically creates the corresponding transaction folder and subfolders in Drive. Mobi will finalize the approach after API research. If Drive integration is not viable within this scope, the in-portal folder storage system will be used exclusively at no change in cost.

Gmail Integration & Email Templates

The portal connects to Kathryn's Gmail Workspace account via OAuth. Outbound emails are sent through the portal using saved templates — agent name, property address, and all transaction variables auto-fill on selection. Sent emails are logged in the client's communication thread. Kathryn can continue to manage her full Gmail inbox and folder structure outside the portal as needed.

Automated Reminder Draft System

Upcoming deadlines trigger automatic email drafts pre-filled with all relevant transaction details. Kathryn reviews each draft, edits as needed, and approves before sending. The system never sends automatically.

Multi-User Access Module

An admin panel allows Kathryn to add team members, assign them to specific transactions, and manage their access. All user activity is logged. Initial access level is equal for all team members — granular role-based permissions are scoped for Phase 2.
